

AI Product Development Engineer (Intern) — Take-Home Assignment

InsideIIM × Altuni AI Labs · Remote · paid · [1-year], with conversion to a full-time role + PPO for strong performers.

About us. InsideIIM is one of India's largest career and community platforms for management and professional talent — used by lakhs of students and many of India's top employers. **Altuni AI Labs** (altunilabs.ai) is our AI lab, building AI products and solutions for enterprises and consumers. **Take a look at what we've shipped** → <https://altunilabs.ai> — you'll be building real, AI-powered features like these, end to end.

In this assignment, we want to see **what you build** and **how you build**, and **AI usage is mandatory**.

The Task

- Build an **AI Investment Research Agent**: it takes a company name, does its research, and decides whether to **invest or pass** — with the reasoning behind its decision.
- That's the goal — how you build it (what it researches, how it works under the hood, how it shows its results) is entirely up to you. We care about **what you build and how you build it**.

Tech stack (this is our production stack — please build with it)

- **React** or **Next.js** (front end) · **Node.js** or **Next.js** (back end) · **LangChain.js** / **LangGraph.js** (for the AI).
- Within that, use any LLM provider and any other libraries / APIs / tools you like.
- Use AI as much as you like while building (that's the job).
- Deploying online (e.g. on **Vercel**) and sharing the link will carry **bonus points**.

Time

- **7 days**.

What to submit

A **zip file** which includes your **code** and a **README** with these sections:

- **Overview** — what it does
- **How to run it** — setup and run steps (plus any keys / env needed)
- **How it works** — your approach and architecture
- **Key decisions & trade-offs** — what you chose and why, and what you left out
- **Example runs** — your agent's output on a few companies of your choice
- **What you would improve with more time**
- **BONUS points**: you are mandated to build this project using a choice of your AI/LLM, during which you will be chatting with the LLM as you build. You will get extra bonus points if you include all the LLM chat session transcript/logs. It will give us insight into your thought process and approach.

Ground rules

- **This is a strictly solo assignment. Code sharing will be detected.** Use AI as much as you like — but you must be able to explain everything you submit.
- If anything is ambiguous, make your own call and note it in the README.
